

The QBriquettes™ Process

Wood Waste

Wood waste is loaded into the feed hopper.

01

02

The Pre-Charger

The screw conveyor carries the material to the pre-charger chamber. The pre-charger compresses the material into the pressing chamber.

03

Compression

The main press piston pushes material into the pressing mould. Compression continues until the material forms a dense block.

04

The Ejectors

The ejectors push the briquette from the previous cycle out through the ejector holes.

05

The Final Step

The briquetting process continues until all of the material in the feed hopper has been processed. They are then packaged and sent out!
